Bermas, B.L., and J.A. Hill.

The Journal of Clinical Investigation. Volume 100, No. 6, September 1997.

Pages 1330–1334.

The authors would like to correct the following errors in statistical values.

In the abstract, instead of $P = \text{NS}$ in line 27, it should read $P = 0.032$.

On page 1332 in the first full paragraph of the left column, the sentence beginning “However, during pregnancy...” should now read:

However, during pregnancy, these responses diverged such that 73% of pregnant controls lost responsiveness to recall antigens during gestation ($P = 0.007$, pregnant vs. nonpregnant fertile controls), while only 41% of pregnant women with a history of RSA lost responsiveness to recall antigens ($P = 0.032$, pregnant vs. nonpregnant RSA subjects).
