Figure S1. Enrichment of hallmark-epithelial-to-mesenchymal-transition genes positively correlate to SUV_{max} . SUV_{max} and gene expression are from institutional PET imaging and RNA-seq data ($n=67$). GSEA was used in the analysis.

Figure S2. Squamous mesenchymal patients show inferior recurrence-free survival compared to adenocarcinoma patients. RNA-seq data are from an institutional cervical cancer cohort ($n=67$). The mesenchymal group was identified as in Figure 1B. Logrank test was used in the analysis with $p=0.022$.

Figure S3. Biological coefficient of variation (BCV) analysis using all expressed genes from TCGA data. Using 12,463 genes expressed in TCGA-CESC cohort ($n=304$), BCV analysis continues to show significant separation of the three major sub-histology EMT groups (blue: squamous epithelial, red: squamous mesenchymal, green: adenocarcinoma), indicating that the grouping based on EMT and histology represents a major biological process in cervical cancer progression. Adenosquamous samples ($n=5$) are shown in purple.

Figure S4. Overall survival for all TCGA-CESC patients and sub-cohort of patients treated with radiation therapy. (A) Squamous mesenchymal patients show inferior overall survival (Logrank test, $p=0.0049$) comparing to other molecular subgroups ($n=298$). **(B)** Kaplan-Meier survival analysis for patients with RT or CRT ($n=183$). Even with the smaller sized sub-histology EMT groups treated with RT, squamous mesenchymal patients still show inferior overall survival compared with the squamous epithelial and adenocarcinoma groups (Logrank test, $p=0.044$). **(C)** Kaplan-Meier survival analysis for patients with RT or CRT but not surgery ($n=79$). Squamous mesenchymal patients still show inferior overall survival compared with the squamous epithelial and adenocarcinoma groups (Logrank test, $p=0.00012$).

Figure S5. Comparison of our sub-histology EMT groups in this study and iCluster-derived molecular groups in TCGA consortium study ($n=178$). TCGA consortium previously identified 3 molecular sub-groups (i.e., keratin-low, keratin-high, and adenocarcinoma-rich) using a cervical cancer subcohort of 178 patients by integrating copy number, methylation, mRNA and microRNA data using iCluster (Nature, 2017). Comparison with the sub-histology EMT groups we have identified in TCGA-CESC data (squamous epithelial (SE), squamous mesenchymal (SM), adenocarcinoma (Adc), adenosquamous (Ads)) for the same 178 cases shows that the two groupings are independent (Chi-squared test $p < 1e-15$).

Figure S7. Discovery of DE genes between squamous mesenchymal and squamous epithelial groups. (A) GSEA ranked “Hallmark Epithelial Mesenchymal Transition” as the most enriched pathway in the squamous mesenchymal subgroup using TCGA data. **(B)** 264 DE genes ($|\log_2 \text{fold-change}| > 1.58$ and $\text{FDR} < 0.01$) were identified between squamous mesenchymal ($n=66$) and squamous epithelial ($n=186$) groups. *CDH2* (N-Cadherin) is the most up-regulated gene in the squamous mesenchymal subgroup. Red color represents genes from Figure 2A, which are correlated with *CDH1*, *CDH2*, *VIM*, or *NF1* expression.

Figure S8. mRNA expression of mesenchymal and epithelial marker genes in four cell lines using qRT-PCR. (A) CaSki has expression for all three mesenchymal marker genes, *CDH2* (N-Cadherin), *FN1* (Fibronectin), and *VIM* (Vimentin). **(B)** C33A only has expression in *VIM*. **(C)** ME-180 only has expression of *CDH1* (E-Cadherin), the epithelial marker gene. **(D)** SiHa has very low expression of *CDH1*, *FN1*, and *VIM*.

Figure S9. Measurement of diameters of CaSki spheroids treated with sham, 6Gy of radiation (RT), Cisplatin (with/without RT), and 2-DG (with/without RT). The blue line shows the measurement of the diameter of a 3D spheroid. Experiments were repeated 6 times.

Figure S10. Relative volumes for CaSki 3D spheroids. As shown in Figure 4D, the relative diameters of CaSki 3D spheroids treated with Cisplatin and 2-DG are significantly different. Estimating the volume of the spheroids based on the measurements of diameters, the difference is more obvious. Experiments were repeated 6 times.

*For TCGA data, missing values (7 patients had missing values for FIGO stage, 46 for surgical status, and 100 for lymph node (LN) involvement) were replaced using Gibbs sampling and pooled results were from 10 simulations. Tumor volume is not available for TCGA data. **Due to the small number of events in the institutional dataset, the factors of LN, FIGO, and volume were analyzed in separate Cox MVA analyses, comparing with sub-histology EMT groups.
