(e) Correlation analysis on T_{H1} , T_{H2} , T_{H17} and T_{REG} cells (%) with SARS-CoV-2 specific IgA. Each dot represents an individual subject. Measured chemiluminescence values divided by the cutoff (S/CO) were used to present the antibody level. P value was analyzed by two-tailed Pearson correlation coefficient.

Figure S5

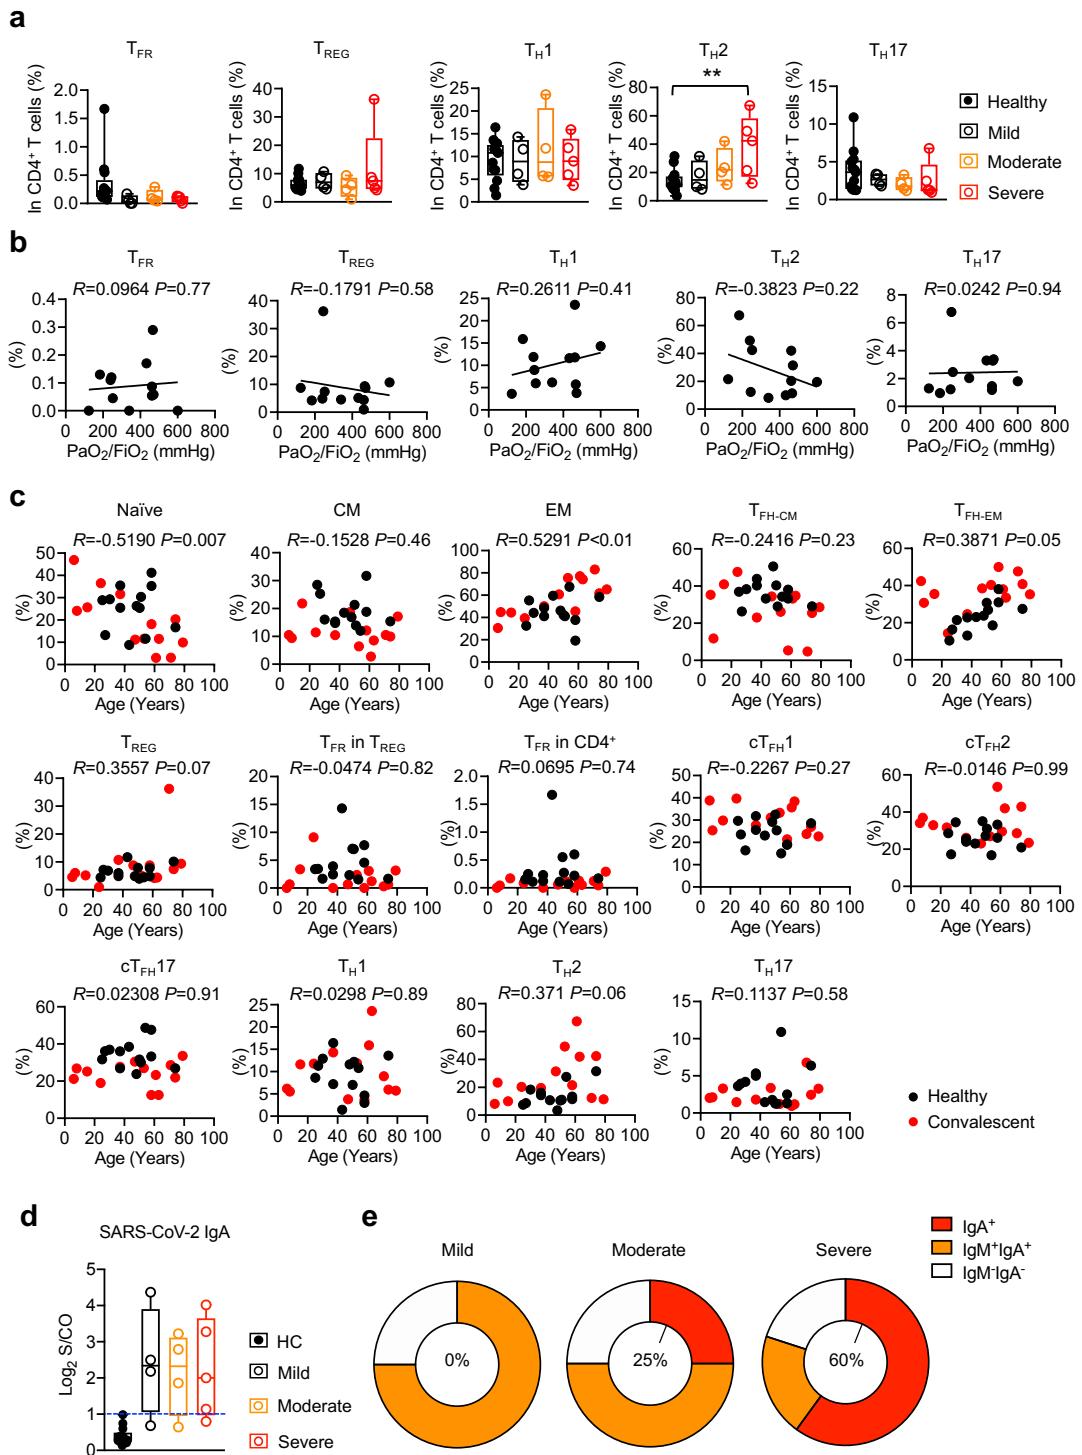

Figure S5. CD4⁺ T cell subsets in different COVID-19 convalescent groups and correlation analysis with age

(a) Statistics showing the frequency of T_{FR}, T_{REG}, T_{H1}, T_{H2} and T_{H17} cells in healthy individuals and different groups of COVID-19 convalescents. Healthy individuals (n=13), mild (N=4), moderate (N=4) and severe (N=5). (b) Correlation of T_{FR}, T_{REG}, T_{H1}, T_{H2} and T_{H17} cells and blood oxygen level (PaO₂/FiO₂) in COVID-19 convalescents. (c) Correlation analysis on age and different CD4⁺ T cell subsets, black dots represent healthy individuals, red dots represent COVID-19 convalescents, overall *R* and *P* values were calculated for each graph. (d) Antibody titer of SARS-CoV-2 specific IgA from convalescent patients in different groups. (e) Ratio of IgM⁺ (no single positive patient in this comparison), IgA⁺ (red), IgM⁺ IgA⁺ (orange) and IgM⁻ IgA⁻ (white) individuals (based on the produced antibody type) in mild, moderate and severe group; percentages in the central circle represent the ratio of IgA⁺ individual in each group. Each dot represents an individual subject. Box plot show min to max. **P*<0.05 and ** *P*<0.01 by One-way ANOVA test or two-tailed Pearson correlation coefficient.
