Animal studies

For the uninephrectomy experiments, the right kidneys were removed under anesthesia. For the medical treatment of mice, 50 mg kg⁻¹ alpelisib (MedChem Tronica) in 1% carboxymethylcellulose (Sigma Aldrich) + 0.5% Tween (Sigma Aldrich) or vehicle (1% carboxymethylcellulose + 0.5% Tween) was administered by oral gavage daily for the indicated time. In addition, blood and urine were obtained at the indicated times. At euthanasia, blood, urine, and kidneys were harvested. In some experiments, the spleen, heart, and bone marrow (BM) in femurs and tibias were also harvested. Tissues were fixed in 4% paraformaldehyde and embedded in paraffin for immunohistochemical analysis, snap-frozen in the Optimal Cutting Temperature (OCT), stored at -80 °C for mRNA or protein analysis, or fixed in 2.5% glutaraldehyde solution for electron microscopy analysis.

Mouse blood and urine measurements

Mouse blood counts were analyzed using a hematology analyzer (ProCyte Dx; IDEXX Laboratories). Mouse serum creatinine, blood urea nitrogen, urinary albumin, and urinary creatinine were evaluated using an AU5800 (Beckman Coulter) autoanalyzer. Serum anti-dsDNA measurement was performed according to the manufacturer's instructions using mouse anti-dsDNA ELISA kit (LBIS), and its absorbance was measured using an Infinite M Nano (TECAN). Serum cytokine measurements were performed according to the manufacturer's instructions using the V-PLEX® proinflammatory panel 1 mouse kit (Meso Scale Discovery, MSD).

Histopathology and immunohistochemistry analysis

For paraffin embedded sections, after deparaffinization, antigen retrieval was performed with citrate buffer (pH6) or Tris-EDTA buffer (pH9 or pH6) using a microwave, pressure cooker, or high temperature (95 °C). The endogenous peroxidase activity was quenched using 3% hydrogen peroxide; nonspecific protein binding was blocked using 2.5% normal horse serum (Vector Laboratories), and the endogenous biotin activity was quenched using the Avidin/Biotin Blocking Kit (Vector Laboratories). When using mouse primary antibodies on mouse tissue, Klear mouse blocking reagent (Diagomics) was used to block endogenous mouse immunoglobulins. After blocking, the tissue sections were incubated with the primary antibodies overnight at 4 °C. The following primary antibodies were used: rabbit anti-Ki-67 antibody (SP6; Thermo Fisher Scientific),

rabbit anti-P-S6RP antibody (D68F8; Cell Signaling Technology), mouse anti-P-AKT (Ser⁴⁷³) antibody (587F11; Cell Signaling Technology), rabbit anti-P-AKT (Thr³⁰⁸) antibody (C31E5E; Cell Signaling Technology), mouse anti-S6RP antibody (54E2; Cell Signaling Technology), chicken anti-GFP antibody (ab13970; Abcam), guinea pig anti-Nephrin antibody (GP-N2; Progen), rabbit anti-Podocin antibody (P0372; Sigma Aldrich), mouse anti-Nestin antibody (4D11, Novus Biologicals), mouse anti-synaptopodin antibody (G1D4, Progen), rat anti-CD44 antibody (IM7, BD Biosciences), and mouse anti-WT1 antibody (6F-H2; DAKO). The corresponding secondary antibodies, including anti-mouse IgG (Thermo Fisher Scientific), anti-rabbit IgG (Thermo Fisher Scientific), anti-guinea pig IgG (Thermo Fisher Scientific), anti-chicken IgG (Abcam), biotinylated anti-rabbit IgG (Vector Laboratories), and biotinylated anti-mouse IgG (Vector Laboratories) were applied. For the Avidin/Biotin detection, an R.T.U. Vectastain Kit (Vector Laboratories) or streptavidin (Thermo Fisher Scientific) was used. The immunoreactive antigen sites were detected with hydrogen peroxide and diaminobenzidine. For alkaline phosphatase detection, alkaline phosphatase conjugate streptavidin (Thermo Fisher Scientific) and BCIP/NBT Substrate Kit (Vectpr Laboratories) were used. For frozen immunofluorescent staining, frozen tissue sections (4 µm) were briefly air dried and fixed in 50% methanol/50% acetone. Then, sections were blocked with 2.5% normal horse serum and incubated overnight at 4 °C with the following primary antibodies: guinea pig anti-Nephrin (GP-N2; Progen), rabbit anti-Ki-67 (SP6; Thermo Fisher Scientific), chicken anti-GFP antibody (ab13970; Abcam), rat anti-PDGFRβ (APB5, eBioscience™), rat anti-CD3 (17A2, eBioscience™), or rat anti-F4/80 (A3-1, Bio-Rad Laboratories), or mouse anti-P-AKT (Ser⁴⁷³) antibody (587F11; Cell Signaling Technology). The sections were then incubated at room temperature for 40 min with the following secondary antibodies: fluorescein isothiocyanate-conjugated (FITC) anti-mouse IgG (Sigma Aldrich), FITC anti-mouse IgM (BD Biosciences), FITC anti-mouse C3 (Abcam) or the corresponding secondary antibodies for the primary antibodies including anti-mouse IgG (Thermo Fisher Scientific), anti-rabbit IgG (Thermo Fisher Scientific), anti-guinea pig IgG (Thermo Fisher Scientific), biotinylated anti-rabbit IgG (Vector Laboratories), and anti-chicken IgG.

Electron microscopy analysis

The fixed samples were washed 3 times in PBS. Samples were postfixed in 1% osmium tetroxide 0.1M (Electron Microscopy Science, UK) in 0.1 M Phosphate Buffer (PB) (pH 7.4). Samples were washed 3 times in H₂O. Samples were dehydrated in alcohol grades :70% Ethanol 10 min, 90% Ethanol 10min, 100% Ethanol 3x15min, 100% Propylene oxide (Electron Microscopy Science, UK) 2X5min. Epikote 812 was prepared with

these proportions: 12.5 mL Embed 812, 7.5 mL Araldite 502, 27 mL DDSA, 1.3 mL DMP30 (kit (Electron Microscopy Science, UK). Resin infiltration was performed as following: mix 1:1 Epikote 812 : propylene oxide 30 min followed by mix 1:2 Epikote 812 : propylene oxide overnight room temperature. Samples were washed in 100% Epikote 812 then embedded in 4mm gelatine capsules in 100% Epikote 812, and Polymerised in 60°C oven for 24hours. Ultrathin sections were cut at 90 nm with a Leica UFC7 ultramicrotome (Leica Microsystems GmbH, Germany) and deposited on Gilder grids 200 mesh (Electron Microscopy Science, UK), They were counterstained with uranyl acetate 7% (LFG, France) and Reynold's lead citrate (LFG, France).

cDNA synthesis and quantitative RT-PCR analysis

Total RNA in the kidney cortex was extracted using NucleoSpin RNA (Macherey Nagel). Complementary DNA was reverse-transcribed using a TaqMan high-capacity cDNA RT kit (Thermo Fisher Scientific). qPCR was performed with iTaq universal SYBR Green Supermix (Bio-Rad Laboratories) using a CFX Connect real-time system (Bio-Rad Laboratories). The expression levels were analyzed using the delta-delta Ct method. *Hypoxanthine phosphoribosyltransferase (Hprt)* was used as the normalization control.

Western blotting

Protein extracts in RIPA buffer from the kidney cortex were separated by SDS-PAGE, transferred onto the membrane and incubated with antibodies, and followed by the appropriate peroxidase-conjugated secondary antibody incubation. The following primary antibodies were used: rabbit anti-P-S6RP antibody (D68F8; Cell Signaling Technology), rabbit anti-P-AKT (Ser⁴⁷³) antibody (D9E; Cell Signaling Technology), rabbit anti-P-AKT (Thr³⁰⁸) antibody (C31E5E; Cell Signaling Technology), mouse anti-S6RP antibody (54E2; Cell Signaling Technology), mouse anti-Akt (pan) antibody (40D4, Cell Signaling Technology), chicken anti-GFP antibody (ab13970; Abcam), mouse anti-alpha-tubulin antibody (B-5-1-2; Sigma Aldrich), rabbit anti-Nephrin antibody (29070; IBL), and rabbit anti-Podocin antibody (P0372; Sigma Aldrich). The chemiluminescence was acquired using ChemiDoc MP (Bio-Rad Laboratories) and densitometry was performed using Image Lab software (Bio-Rad Laboratories, version 6.0.1).

Flow cytometry

For lymphocyte, granulocyte and monocyte lineage analysis, anti-CD3a antibody (500A2; Becton Dickinson), anti-CD4 antibody (L3T4; Becton Dickinson), anti-CD8a antibody (63-6.72; Becton Dickinson), anti-B220

antibody (RA3-6B2; Becton Dickinson), anti-CD11b antibody (M1/70; Becton Dickinson), anti-Ly6G antibody (RB6-8C5; Becton Dickinson), and CD16/CD32 (2.4G2; Becton Dickinson) were used. Cells were resuspended in 0.2 to 1 mL of PBS +2%FCS + 2 µL of 7-aminoactinomycine D (7-AAD, Thermo Fischer Scientific).

Imaging flow cytometry (Amnis ImageStream)

Following the single-cell suspension procedure, flow cytometry cell preparation was conducted by essentially following the Flow Cytometry Protocol by Cell Signaling Technology. Briefly, cell samples were fixed with 4% PFA for 15 min, permeabilized with methanol on ice, and resuspended in PBS after several washes. The samples were labeled with rabbit anti-P-S6RP-AF647 antibody (D68F8; Cell Signaling Technology) and/or rabbit anti-P-Akt^{Thr308}-PE antibody (D25E6; Cell Signaling Technology). Rabbit IgG isotype controls (AF647 and PE; Cell Signaling Technology) were used. Resuspended cells were run on an ImageStream ISX mkII (Amnis) that combines flow cytometry with detailed cell imaging. Magnification (40×) was used for all acquisitions. Data were acquired with INSPIRE software (Amnis) and analyzed with IDEAS software (v.6.2, Amnis).

Single-cell RNA-seq barcoding and cDNA synthesis

The scRNA-seq libraries were generated using a Chromium Single Cell 3' Library & Gel Bead Kit v.3 (10x Genomics) according to the manufacturer's protocol. Briefly, suspended single-cells were counted, diluted at 1,000 cells/µL in PBS + 0.04% BSA, and 20,000 cells were loaded in the 10x Chromium Controller to generate single-cell gel-beads in an emulsion. After reverse transcription, the gel-beads in the emulsion were disrupted. Then, barcoded complementary DNA was isolated and amplified by PCR. Following fragmentation, end repair and A-tailing, sample indexes were added during index PCR. An equimolar pool of the 4 individual 10X Genomics Single Cell Expression 3' V3 libraries was prepared by the Imagine Genomic Core Facility and sequenced on an S2 FlowCell using the NovaSeq6000, Illumina (sequencing mode Paired-End 100+100 bases + indexes). A total of 2 billion reads were targeted for this pool of 4 libraries (500 million reads per library).

Single-cell RNA-seq pre-processing

Sequencing data quality analysis was performed using FastQC v0.11.2 on 4 samples. For read alignment and quantification of unique molecular identifiers (UMI), CellRanger software v3.0.2 was used on Mus Musculus genome mm10 with default parameters and gene annotation from Ensembl 100 (plus eGFP and tdTomato). The 4 expression matrices containing the UMI counts were merged, and only the genes with UMI ≥ 1 in at least one cell were kept. The following filters were applied to generate a global matrix used in further analysis: cells with UMI ≥ 2000 , number of detected genes ≥ 600 , and cells with UMI in mitochondrial genes $\leq 60\%$. For the normalization of UMIs, Seurat 3.1.1 was used(1) and a global-scaling normalization method was applied with a scale factor of 10,000 and log-transformation of data. This was followed by a scaling linear transformation step to avoid highly-expressed genes with a higher weight in downstream analysis.

Clustering and marker genes

PCA was performed on the scaled data with a Jackstraw plot to choose how many PCs to retain as an input for the Seurat clustering step. The clustering step was performed using default parameters, the Louvain algorithm as the clustering method, and 15 PC and a resolution parameter defining the cluster granularity set to 0.5. Marker genes defining each cluster were found via differential expression testing with a Wilcoxon rank sum test and a log fold change threshold of 1.

Trajectory analysis

The Monocle single-cell trajectory was constructed using M3Drop(2) and Monocle 2.10.1(3). Input genes for the Monocle trajectory construction were selected using an unsupervised approach via the M3Drop result, which identifies differentially expressed genes based on a Michaelis-Menten function for the relationship between mean expression and dropout rate with the relevant genes being the ones shifting above a fitted curve. The default Monocle workflow was then performed to generate the trajectories.

Enrichment analysis

An analysis for enriched KEGG pathways and Gene Ontology (GO) terms was performed using the WebGestaltR package(3) on databases from the Mus Musculus organism. GO terms and pathways were considered enriched if fold enrichment was ≥ 2.0 , the uncorrected p-value was ≤ 0.05 and a minimum number of regulated genes in pathway/term ≥ 2.0 was achieved.

LC-MS analysis of alpelisib

Each tissue type was homogenized in 100% cold methanol with a tissue-to-solvent ratio of 1-mg tissue to 5- μ l methanol. After sonication for 20 s, the tissue extract was centrifuged at 13,000 \times g for 30 min and then injected onto a Phenomenex Kinetex XB-C18 HPLC column (100 mm by 2.1 mm) at 45 °C. Alpelisib was analyzed by reverse-phase HPLC (Shimadzu LC-MS system 8040 interfaced with LabSolutions software). Twenty micrograms of tissue extracts were injected onto a column, and the mobile phase used for the separation consisted of two eluents as follows: Solvent A was 0.1% formic acid in ddH₂O, and solvent B was acetonitrile with 0.1% of formic acid. The compounds were separated using the following discontinuous gradient at a flow rate of 0.6 ml/min: the initial concentration of 20% in solvent B increased to 70% over 6 min, and this was followed by a decrease to 20% over the next minute and the initial conditions were then maintained for 14 min. The alpelisib was monitored spectrophotometrically by absorbance (photodiode detector) from 205 to 600 nm and by tandem mass detection. The mass measurement was implemented in positive ion mode using multiple reaction monitoring (MRM) with an electrospray ionization source. Three MRM transitions for alpelisib are used as follows: 442.1 > 328.0, 442.1 > 288.0, and 442.1 > 115.1. Quantification was conducted by integration of the peak absorbance area using a calibration curve established with various known concentrations of alpelisib.

Spatial transcriptomics

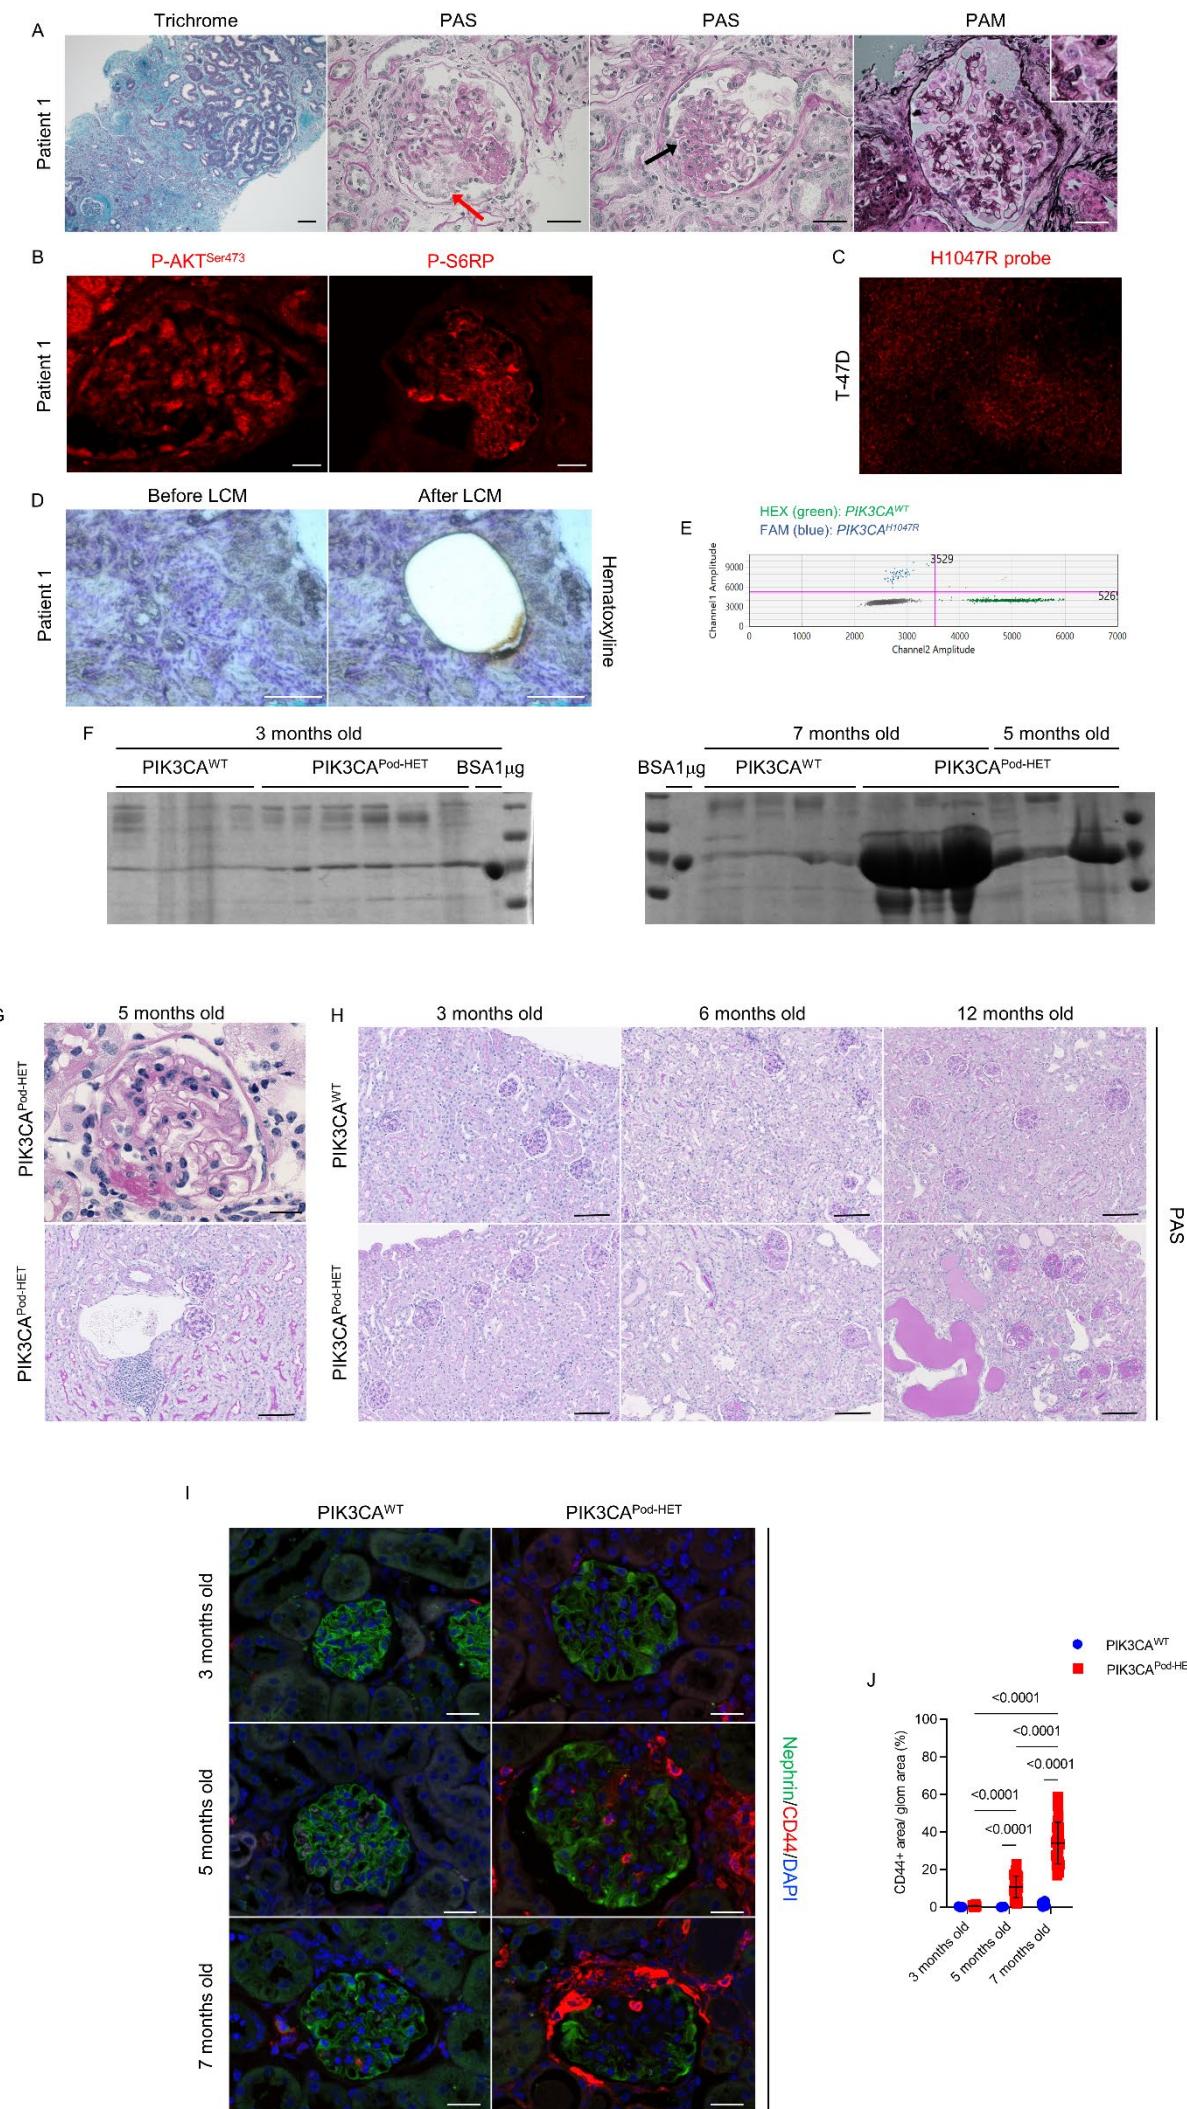

Briefly, 4 μ m of AFA-fixed paraffin-embedded human samples were baked overnight at 37 °C and 1 hour at 65 °C, and then they were processed on a Leica automation platform with a protocol including three major steps as follows: 1) slide baking, 2) antigen retrieval for 20min at 100 °C, and 3) 1.0ug/ml proteinase K treatment for 15min. After taking the slide off of the Leica, they were incubated with a GeoMx WTA assay probe cocktail overnight. The following day, the slides were washed and applied with morphology marker incubation before loading onto the GeoMx machine. On the GeoMx machine, slides were fluorescently scanned and finished ROI selection. Barcodes were collected and subsequent barcoding readings were performed on an Illumina NGS platform. Individual counts were normalized against the 75th percentile of the signal from their own ROI (Q3 Normalization).

Human PBMC flow cytometry experiment and supernatant cytokine measurement

PBMC were sorted for CD3+ T cells and CD19+ B cells with anti-CD3 (clone UCHT1, Sony Biotechnology), anti-CD19 (clone HIB19, Sony Biotechnology), and 7-AAD using BD FACS Aria II SORP. CD3+ T cells or CD19+ B cells were incubated in RPMI 1640 media (Thermo Fischer Scientific) containing 10% FBS, 2mM glutamine, 100 U/ml penicillin and streptomycin (Thermo Fischer Scientific). To stimulate T cells, Dynabeads™ Human T-Activator CD3/CD28 (Thermo Fischer Scientific, ref. 11161D) and 1000 U/mL recombinant human interleukin-2 (IL-2) (Proteintech, ref. 200-02) were used. To stimulate B cells, 2.5 ug/ml resiquimod (Sigma Aldrich, ref. SML0196) and 1000 U/mL recombinant human IL-2 were used. For in vitro experiments, alpelisib was dissolved in DMSO (5mM) as a stock solution and T cells or B cells were pre-treated with the indicated concentration of alpelisib for 30 min before starting the stimulation or left unstimulated. CD19+ B cells were collected 16hr after stimulation and treatment, while CD3+ T cells were collected either 16hr or 7 days after stimulation and treatment. Upon cell collection, the supernatants were also collected. Cells were fixed and permeabilized using BD Cytofix (BD Biosciences, ref. 554655) and Perm Buffer III (BD Biosciences, ref. 558050), followed by intracellular staining with P-S6RP (Ione D68F8, Cell Signaling Technologies). CD69 (clone FN50, Sony Biotechnology) was used as activation marker. The flow cytometry analysis was performed with a Sony ID7000™ spectral cell analyzer. Data were analyzed with FlowJo software (TreeStar). Supernatant cytokines were analyzed with a V-PLEX® proinflammatory panel 1 human kit (Meso Scale Discovery, MSD).

Supplemental Figure 8

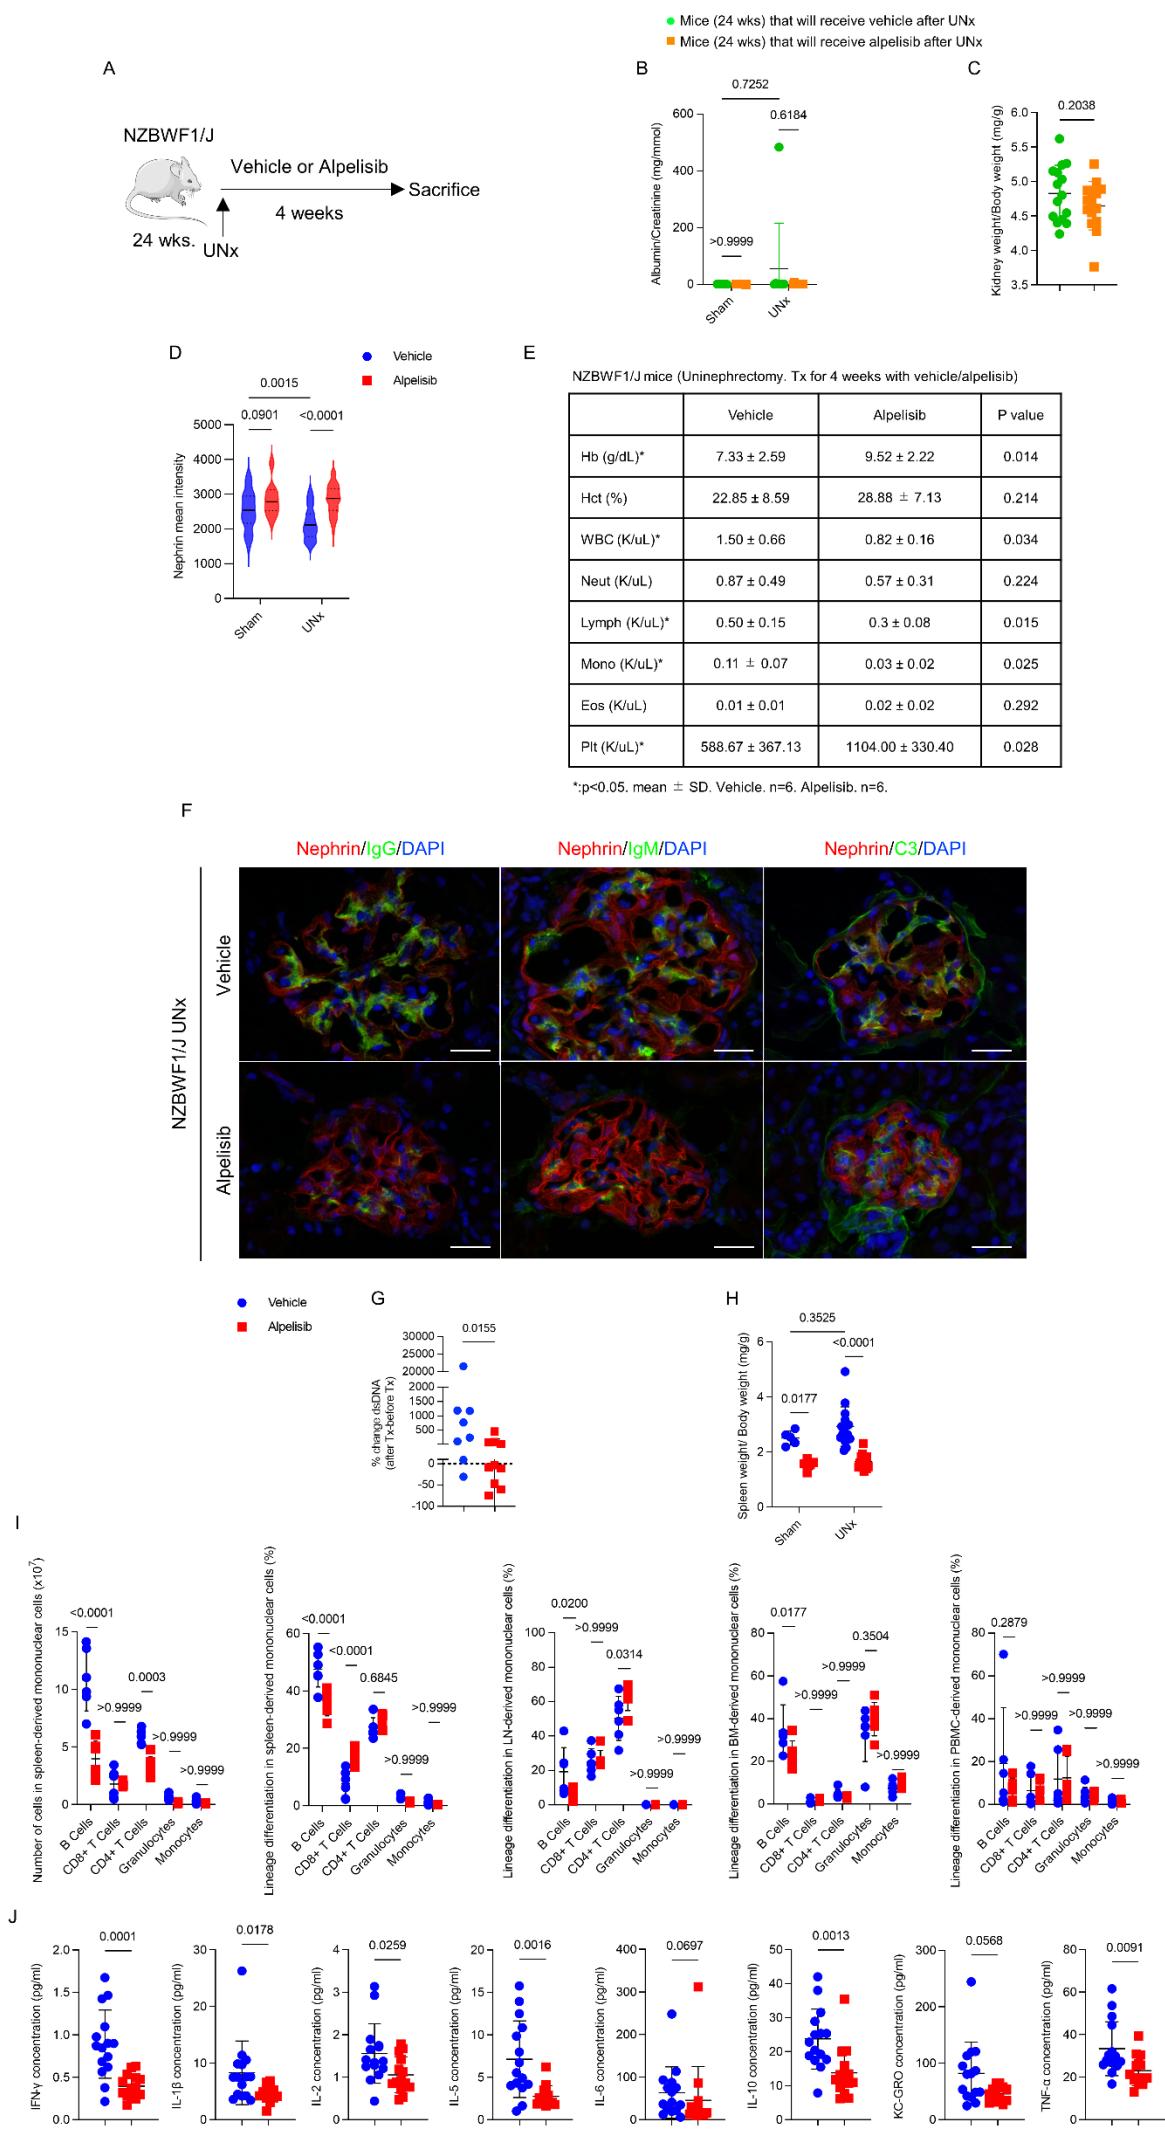

Supplemental Figure 8: Human kidney biopsies used for glomerular spatial transcriptomics. **(A)** Representative immunofluorescence staining of P-AKT^{Ser473} (frozen section) in kidney biopsies from patients with lupus nephritis (LN), ANCA vasculitis or controls (n=4 patients per group). Note the images are the split channel images of Figure 4A. **(B)** Representative kidney staining (Trichrome staining and immunofluorescence of IgA, IgG, IgM, C3, and C1q) for controls and LN patients. **(C)** Patient biopsy information and NIH classification for LN to demonstrate the activity of the disease. A total of 49 ROI distributions among each sample are shown. **(D)** Schematic of the spatial transcriptomics workflow. Two slides were analyzed. On each slide (slide A and B), 2 LN kidney biopsies and 2 control kidney biopsies were assigned to avoid batch effects between the slides. CD10 + CD31, PanCK, and DNA were used to visualize the kidney structure to enable selection of the region of interest (ROI). Representative ROIs for controls and LN are shown. **(E)** T-distributed neighbor embedding (t-SNE) plot showing the distribution of LN (in blue) and controls (in red) glomeruli. **(F)** Representative Nephron/P-AKT^{Ser473} immunofluorescence staining for LN kidneys. With mean intensity quantification, the LN ROIs were classified either as pAKT activity-low or pAKT activity-high. Scaler bars: 20 μ m (**A, B, F**).
