

Supplementary Figure 1

Immunostaining of Ipf1 in islets. Sections were double-stained with anti-Ipf1 antibody and a cocktail of anti-glucagon, anti-somatostatin, and anti-pancreatic polypeptide antibodies. Representative islets captured on a computer are shown. Ipf1 positive-cells are stained brown, and non-beta-cells are stained red. Bars: 100 μ m.

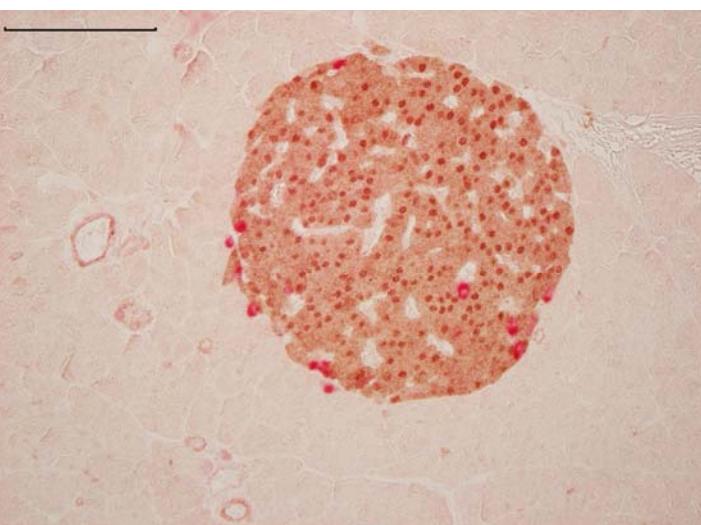

Wild-type mice on the standard-chow diet

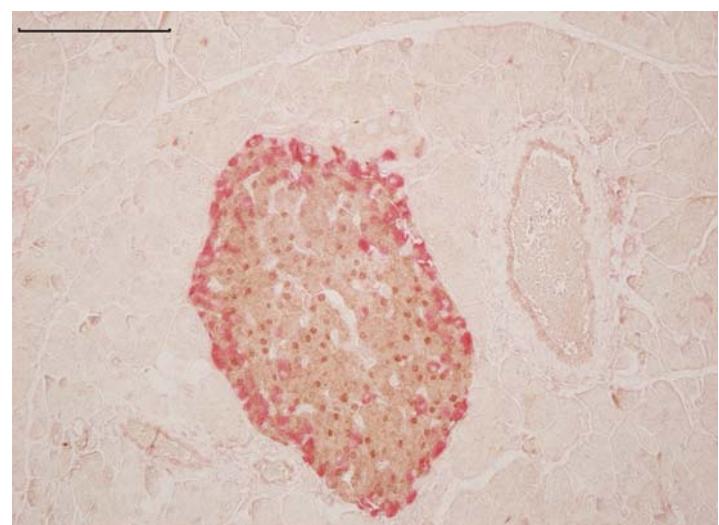

$Gck^{+/-}$ mice on the standard-chow diet

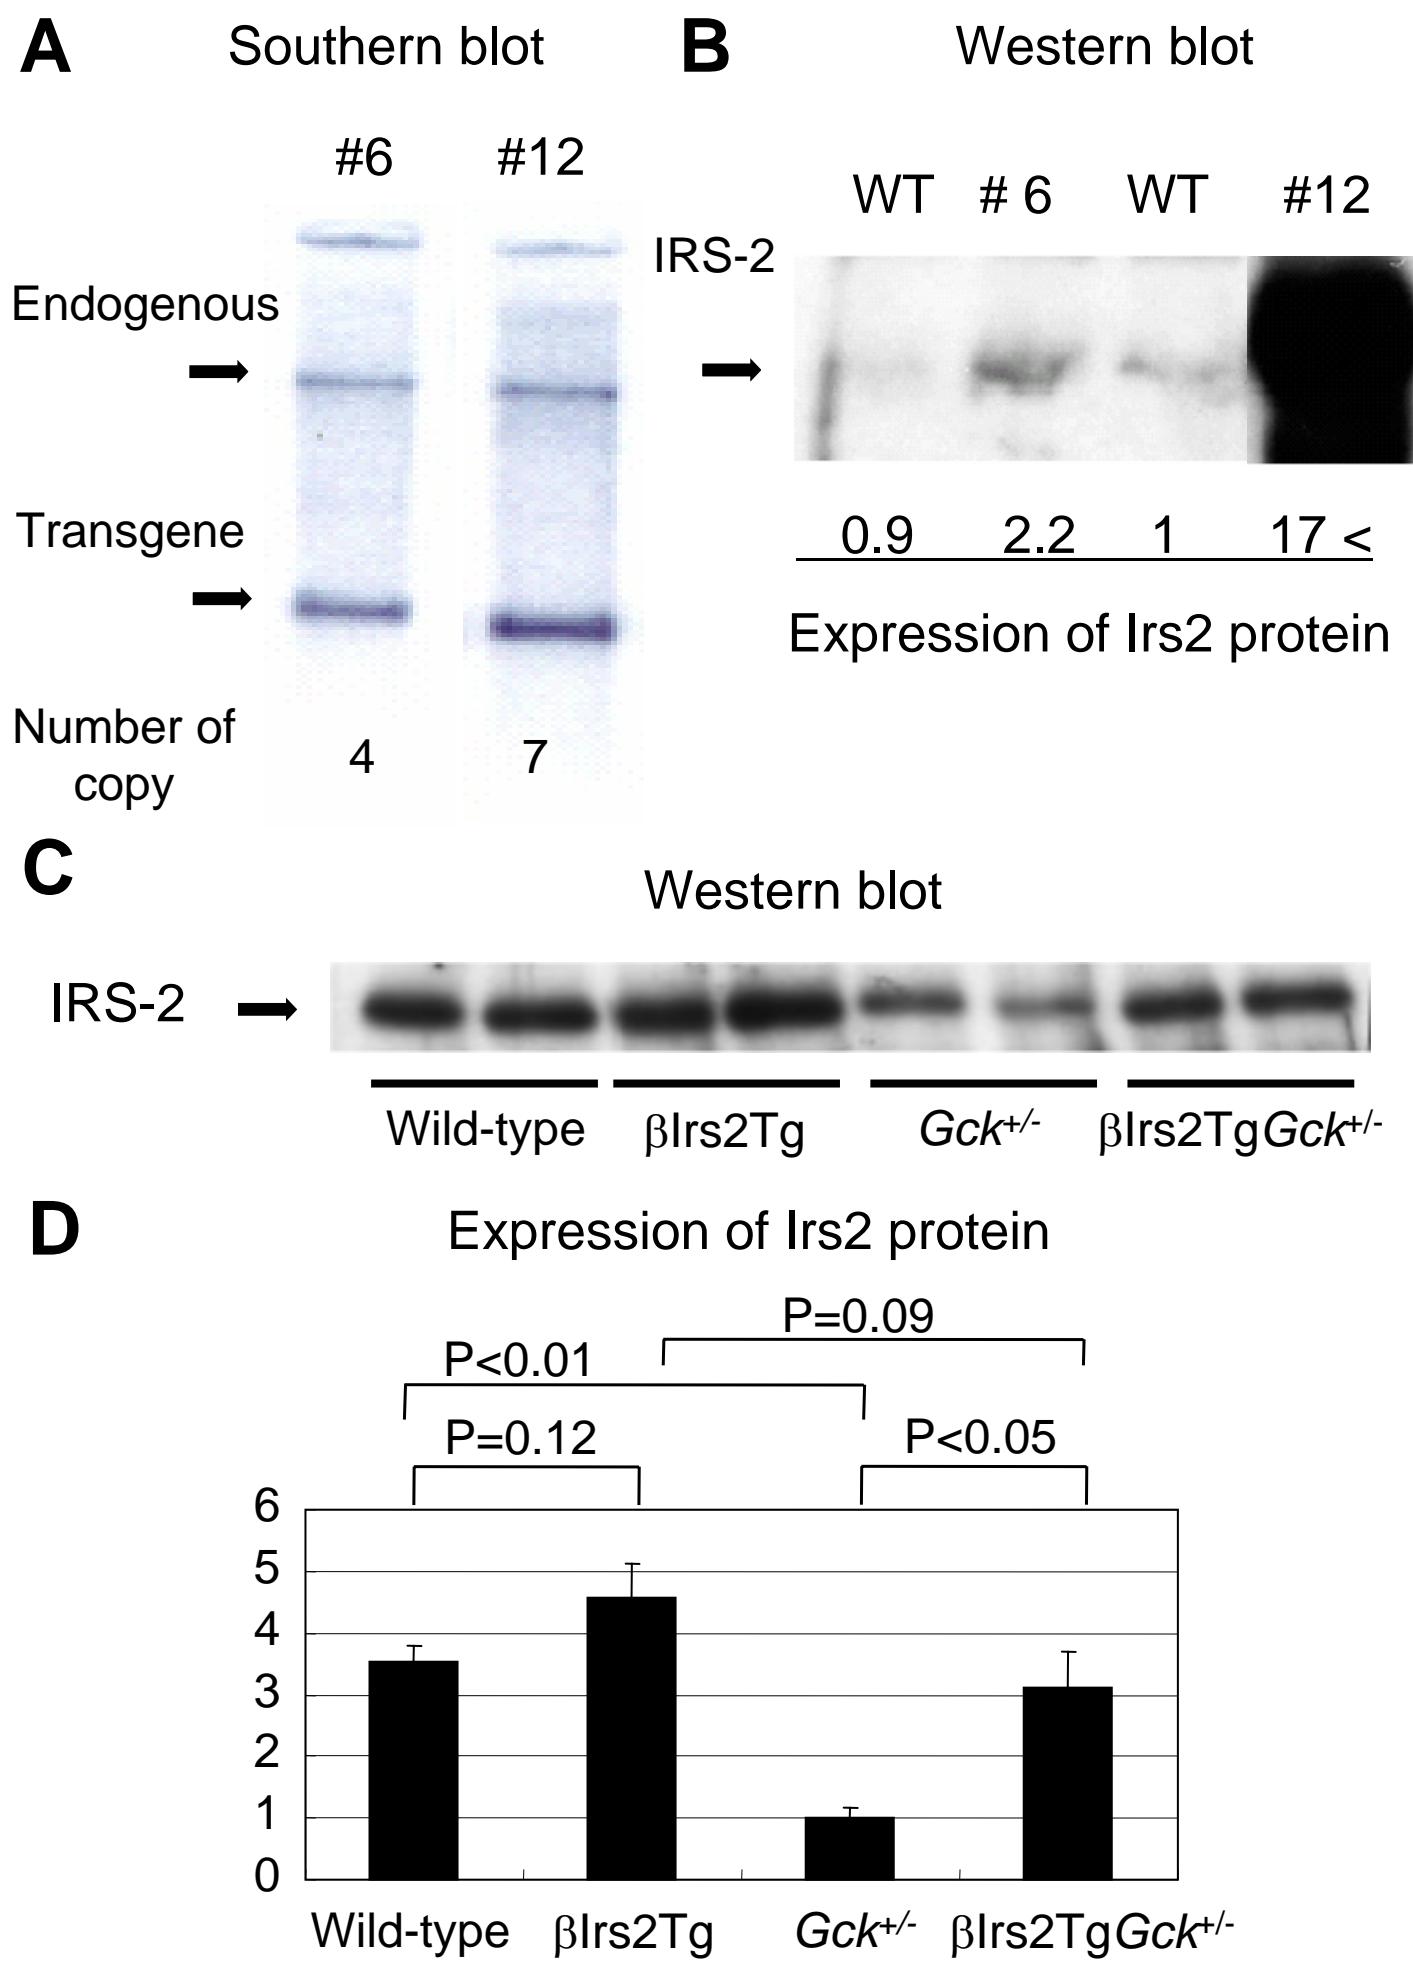

Wild-type mice on the HF diet

$Gck^{+/-}$ mice on the HF diet

Supplementary Figure 2

Supplementary Table 1. List of overexpressed genes in islets from the Gck(+/-) mice on the high-fat diet compared to the islets from the wild-type mice on the high-fat diet

	Description	gene	ratio	wild-type signal

Ratio means the ratio of level of expression in wild-type mice to that in Gck (+/-) mice, and "wild-type signal" means the intensity of level of expression in wild-type mice. Statistical significance was calculated with Microarray Suite software.

Although LIM and SH3 protein1 (1) and caspase 3 (19) were underexpressed in this table, these results were not reproduced in the identical genes which were contained in this microarray. We therefore assume that expression levels of LIM and SH3 protein 1 and caspase 3 were not essentially altered between the two mouse groups.
