

Supplementary Figure 1

Supplementary Figure 2

Supplementary Figure 1

Total lymphocyte counts following islet transplantation for individual patients, Results are shown for the first 30 days after the first islet infusion ($n=13$), after the second islet infusion in patients who received two infusions ($n=11$), and after the third infusion in 3 patients.

Supplementary Figure 2

Sequential values of lymphocyte Ki-67 positivity (open circle, left ordinate axis) and serum IL-7 concentrations (filled circle, right ordinate axis) relative to days post-transplantation (abscissa) in the second patient who was alternated from rapamycin to micophenolate mofetil due to rapamycin intolerance (patient hSR-063-ITA-Rp03). The period of therapy for anti-IL2R (filled black bars), FK506 (hatched bar), MMF (filled light gray bars), and rapamycin (filled dark gray bars) and is indicated below the abscissa.
