<sup>1</sup> The association analysis was performed by logistic regression and adjusted by gender introducing it as a covariate in the regression model. <sup>2</sup> Only the patients with nephritis were considered as cases. OR: odds ratio, L95: lower limit of the 95% confidence interval, U95: upper limit of the 95% confidence interval.

**Supplementary table S2 Case-only meta-analysis of the human KLK region polymorphism comparing SLE cases with nephritis to SLE cases without nephritis.**

P<sub>CMH</sub>: P-value from the Cochran-Mantel-Haenzel meta-analysis performed within cases, which takes into account the variability across the different strata, in this, cases the patient's clinical center. P<sub>HOMOG</sub>: P value for the homogeneity test between strata. The non-significant results indicate homogeneity of the association. OR: odds ratio, L95: lower limit of the 95% confidence interval, U95: upper limit of the 95% confidence interval.

The linkage disequilibrium structure of the region showed 12 haplotype blocks (see figure 6A). These blocks were tested for haplotype association by both omnibus and haplotype-specific association statistics (T test) as implemented in PLINK. The case/control omnibus test is an H-1 degree of freedom test, if there are H haplotypes. The two most significant associations (\*) correspond to haplotypes with a lower frequency in patients, even less in the subgroup of patients with nephritis, reflecting a protective effect conferred by the KLK polymorphisms
